WebServer: Why does
multiplying the value of an
assignment pointer with an
integer creates a pointer address

```
int main() { int *ptr; int x = 5;  
ptr = &x; int *pt = *ptr; pt = pt  
+ 1; }
```

In the above program,

the value `x` is assigned to the variable `ptr`, so `ptr` should point to `x` and the type of `ptr` should also be `int`. Now, when I change

`*ptr` to `*ptr * 4`, it creates a double pointer. Why does this happen, and what is actually going on inside the machine?

A: Let me make it clear. `int *ptr; //` is only a declaration `int *pt; //` is only an initializer `int x = 5; //` is only an assignment of an expression to a variable (not

variable declartion) `int *ptr = &x; //` is an initialization of a new variable by an expression (not assignment) `int *pt = *ptr; //` is an initialization of a new variable by another new variable. `pt = pt + 1; //` is an initialization of a new variable by another new variable. That's it. Mother Against Film Distortion Mother Against Film Distortion (abbreviated as MATF) is the official

organization for people who oppose film distortion, a national organization in the United States. History In 1978, the Société québécoise d'études cinématographiques was founded in Quebec, Canada to promote and defend film quality. In 1979, the Federation of Québécoise Film Clubs (FQFC) and the Société québécoise d'études cinématographiques became

partners. In 1982, they founded a national organization in the United States, named Mother Against Film Distortion (MATF). The organization's stated mission is to "assist members and affiliates in the development of film criticism, to help educate their members to recognize cinematic distortions and to provide one another with the necessary information and inspiration to

attack film critics who persist
in distorting the medium by
giving it the status of art."
